Product Group: MARLIN I-Pro **Product:** CMDM 6600 – Microlog Inspector **Version:** 1.3 and higher

Abstract

There may be situations where testing Microlog Inspector network settings from a desktop computer will be necessary. This article describes a way to test server settings from a desktop computer using the SKF Microlog Inspector Settings utility.

Overview

The Microlog Inspector Settings utility came with the release of Microlog Inspector version 1.3. This utility gives the user the ability to test a network connection to a server from a computer prior to sending the server settings down to the handheld.

1. Go to Start > Programs > SKF > Microlog Inspector Tools > Microlog Inspector Settings. [Figure 1]

SKF Reliability Systems 5271 Viewridge Court * San Diego, Califo

3. If the connection is successful, the network settings can then be passed down to the handheld by pressing the **Set** button. To check the current network settings in a handheld, press the **Retrieve** button. The handheld must be docked and an ActiveSync or Windows Mobile Device Center connection must first be established.
